

The Design of Software Architecture

- 1 What is it?
- 1 Why study it?
- 1 How do you do it?
 - Design the high-level system structure
 - Design the control model
 - Perform modular decomposition
- 1 Use a domain-specific architecture if one exists.

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 1

What is software architecture?

- 1 It is a description of the overall structure of the software system
- 1 It is a description of the sub-systems that make up a system and the framework for sub-system control and communication.

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 2

What is architectural design?

- 1 It is the process of figuring out the architecture.
- 1 It is an early stage of the system design process.
- 1 It involves identifying major system components and their communications.

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 3

Why study software architectures?

- 1 There are several advantages to designing and documenting an explicit software architecture....
- 1 Stakeholder communication
 - Architecture can focus discussion by system stakeholders
- 1 System analysis
 - Means that analysis of whether the system can meet its non-functional requirements is possible (performance, reliability, maintainability, and usability).
- 1 Large-scale reuse
 - The architecture may be reusable across a range of systems

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 4

Three high-level activities in the architectural design of a large system

- 1 Design the high-level system structure.
 - Decompose the system into the principal subsystems, and identify the communication and data flow that would be necessary among the subsystems.
- 1 Design the high-level control model.
 - Establish a model of the control relationships among the various subsystems.
- 1 Further decompose each subsystem.
 - Perform modular decomposition, and design the architecture of each subsystem.
- 1 (Large systems rarely conform to a single architectural model.)

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 5

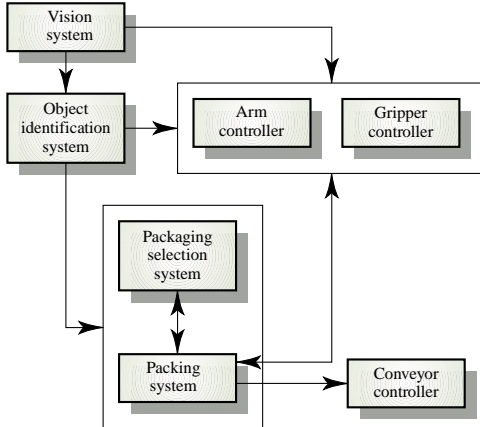

Design the system structure

- 1 Decompose the system identifying the various necessary interacting sub-systems
- 1 The architectural design is normally expressed as a block diagram presenting an overview of the system structure
- 1 More specific models showing how sub-systems share data, are distributed and interface with each other may also be developed

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 6

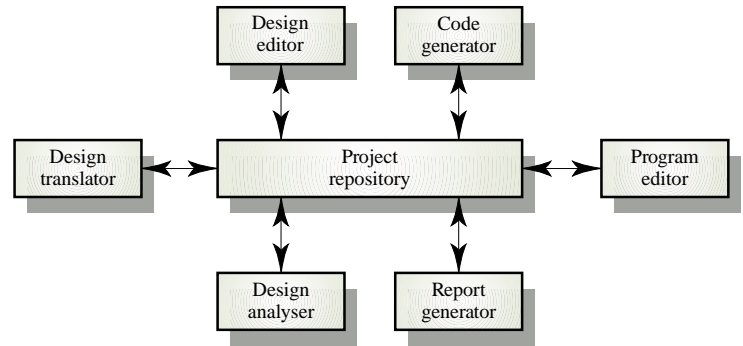

The system structure of a packing robot control system

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 7

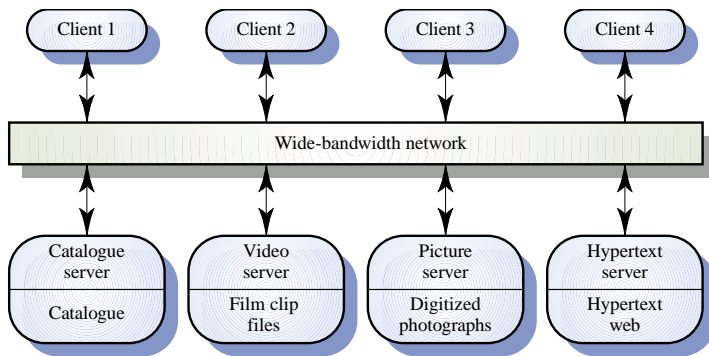

The system structure of a CASE toolset that uses a data repository model

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 8

The system structure of a film and picture library that uses a client-server model

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 9

Question

- (Sommerville 10.3) Suggest an appropriate structural model for the following systems:
 - An automated ticket issuing system used by passengers at a railway station
 - A computer-controlled video conferencing system which allows video, audio, and computer data to be visible to several participants at the same time.
 - A robot floor cleaner that cleans relatively clear spaces such as corridors. The cleaner must be able to sense walls and other obstructions.

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 10

Design the control model

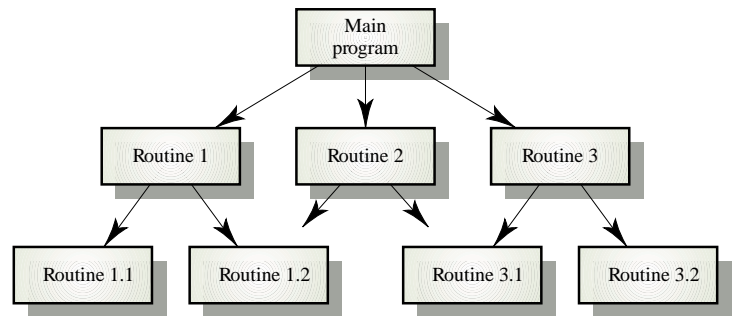

- Identify the control flow between subsystems. Distinct from the system decomposition model
- Centralized control
 - One subsystem has overall responsibility for control and starts and stops other sub-systems
- Event-based control
 - Each subsystem can respond to externally generated events from other subsystems or the system's environment

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 11

A call-return centralized control model

Top-down subroutine model where control starts at the top of a subroutine hierarchy and moves downwards. Applicable to sequential systems.

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 12

A “manager” centralized control model

In this model, for a real-time system. One system component controls the stopping, starting and coordination of other system processes.

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 13

Question

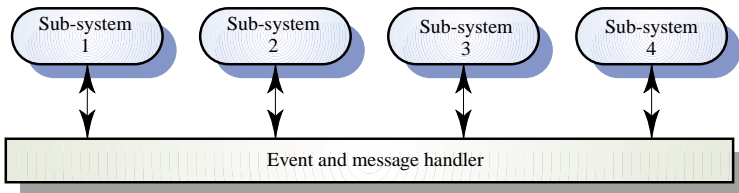

- 1 (Sommerville 10.5) Why is a call-return model of control usually not suitable for real-time systems?

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 14

An broadcast event-based control model

Events are broadcasted to all subsystems. Subsystems register an interest in specific events, and receive control when those events occur.

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 15

An interrupt-driven event-based control model

Used in real-time systems where interrupts are detected by an interrupt handler and passed to some other component for processing

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 16

Question

- 1 (Sommerville 10.6) Suggest an appropriate control model for the following systems:
 - A batch processing system which takes information about hours worked and pay rates and prints salary slips and bank credit transfer information
 - A set of software tools which are produced by different vendors but which must work together
 - A television controller which responds to signals from a remote control unit

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 17

Modular decomposition

- 1 Another structural level where subsystems are decomposed into modules
- 1 Two modular decomposition models will be discussed
 - An object model where the system is decomposed into interacting objects
 - A data-flow model where the system is decomposed into functional modules which transform inputs to outputs. Also known as the pipeline model

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 18

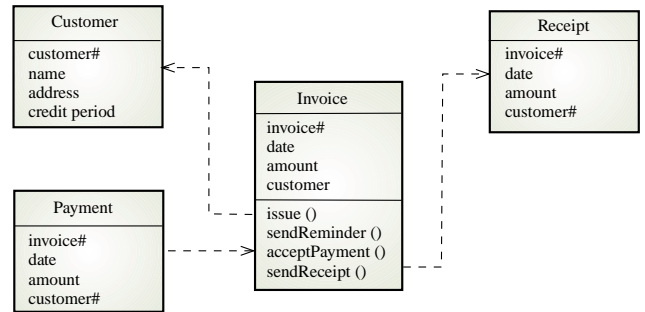

Object model modular decomposition

- 1 Structure the system into a set of loosely coupled objects with well-defined interfaces
- 1 Object-oriented decomposition is concerned with identifying object classes, their attributes and operations
- 1 When implemented, objects are created from these classes and from a control model used to coordinate object operations

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 19

Object model of an invoice processing system

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 20

Data-flow model modular decomposition

- 1 Functional transformations process their inputs to produce outputs
- 1 May be referred to as a pipe and filter model (as in UNIX shell)
- 1 Variants of this approach are very common. When transformations are sequential, this is a batch sequential model which is extensively used in data processing systems
- 1 Not really suitable for interactive systems

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 21

Data-flow model of an invoice processing system

This sort of diagram is also known as a data-flow diagram (DFD)

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 22

Three high-level activities in the architectural design of a large system

- 1 Design the high-level system structure.
- 1 Design the high-level control model.
- 1 Further decompose each subsystem, performing modular decomposition.

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 23

Domain-specific architectures

- 1 Architectural models which are specific to some application domain
- 1 Use them whenever you can
- 1 “Generic models” are abstractions from a number of real systems, abstractions that encapsulate the principal characteristics of these systems.

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 24

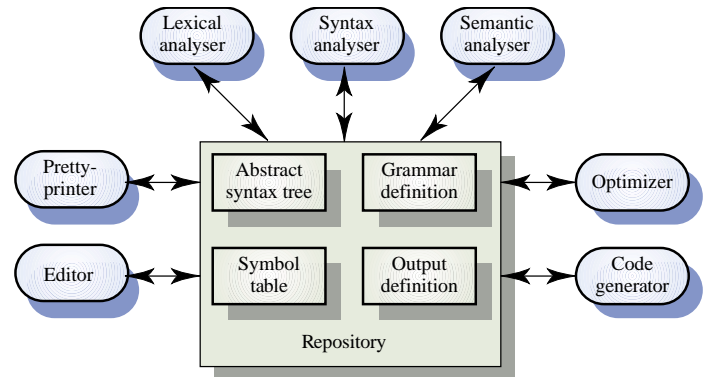

Generic compiler architecture

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 25

Generic language processing system

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00

Slide 26

Summary

- 1 The software architecture is a description of the overall structure of the software system.
- 1 It is an important component of system design.
- 1 Major activities include
 - Designing the system structure
 - Designing the control model
 - Performing further modular decomposition.
- 1 Use domain-specific architectures when you can.

From Ian Sommerville (2000) *Software Engineering*, 6th edition. Adapted by A.Hornof, 10/8/00
