

## Lecture 3

### Human-Centered Development and the Scenario-Based Approach

---

---

---

---

---

---

---

## Part 1: Human-Centered Development

---

---

---

---

---

---

---

**DILBERT**

YOU HAVE CHRONIC  
MAHJOBBS CRAPPUS  
BUT THAT'S NOT WHY  
YOU VUKED.

HAVE YOU BEEN  
EXPOSED TO ANY  
USER INTERFACES  
DESIGNED BY  
ENGINEERS?

YES.

YOU HAVE INTERFACE  
POISONING. YOU'LL  
BE DEAD IN A WEEK.

---

---

---

---

---

---

---

## Three Approaches to UI Design

- Attitude of technology-centered development
  - Progress made by technological advances
  - The more bells & whistles the better
- Attitude of designer-centered development
  - Progress made by considering the intuitions of the designer
  - Imagining what the user will do and feel
- Attitude of human-centered development
  - Progress made by incorporating the users into the design process
  - Empirical studies integrated early into the design

---

---

---

---

---

---

---

---

## The User “Interface” as Human-Computer Interaction

### Definition

- Any part of the computer system that the user comes in contact with either physically, perceptually, or conceptually.

---

---

---

---

---

---

---

---

## Human-centered software development

- Definition
  - Early and Continual Focus on Users
    - Direct contact through interviews, observations, surveys, participative design in order to understand characteristics of users and their jobs
  - Integrated Design
    - All aspects of usability evolve in parallel: All aspects of usability under one focus or person
  - Early and Continual User Testing
    - Throughout development, intended users do real work with simulations and prototypes; their performance and reactions are measured qualitatively and quantitatively
  - Iterative Design
    - The system (functions, user interface, help system, reading material, training approach) is modified based upon results of user testing; testing cycle is repeated

---

---

---

---

---

---

---

---

## Iterative Model of Development

- Describe steps in method

Compare to the Waterfall Model

---

---

---

---

---

---

---

---

## Steps in method (note: iterative!)

- Planning
  - Scope of project, investigate user population (document analysis, interviews, surveys, observation) & related systems
- Analysis (R&C Requirements Analysis)
  - Task analysis, problem scenario development, requirements for usefulness and usability
- Design (R&C Activity, Information & Interaction Design)
  - Specifications (yes!) for the human-computer interaction (UI?)
- Implementation (R&C Prototyping)
  - Storyboards, mock-ups, software prototypes
- Usability Evaluation (R&C Evaluation )
  - Evaluation without users: cognitive walkthrough, heuristic evaluation (guidelines), GOMS, Keystroke Level Model (KLM)
  - Evaluation with users (usability testing, interviews, questionnaires)

---

---

---

---

---

---

---

---

## Purpose of Human-Centered Development

- Usefulness (Functionality)
- Usability for skilled users
  - Performance time
  - Failure (Errors)
  - Enjoyment
  - Robustness
  - Fatigue/Stress
  - Safety
- Learnability
  - Learning time
  - Misconceptions

---

---

---

---

---

---

---

---

## Part 2: Scenario-Based Design

Chapters 1 & 2  
Rosson & Carroll

---

---

---

---

---

---

---

---

---

---

---

---

---

---

### What is a scenario?

- A story about people and their activities containing the five “W’s”
  - When
  - Where
  - Who
  - What (and How)
  - Why

---

---

---

---

---

---

---

## Matching the W's to Scenario Components

- When: Setting
- Where: Setting
- Who: Actors/Stakeholders
- What (and How): Tasks, activities, plans, resources, events
- Why: Goals, rationale, claims, expectations, benefits

---

---

---

---

---

---

---

## Why scenarios?

- Context-sensitive: bring out the situation of use
- Vivid descriptions: Easy to create and remember
- Can be used in many ways during development
  - Current work practices scenario
  - Proposed system problem scenario
  - Activity scenario
  - Usability testing task scenario

---

---

---

---

---

---

---

## Requirements Analysis

- Definition: Early phase of software development in which needs of clients with respect to a proposed system are analyzed
- Evolving detailed description of *what* the system should do and why
- Does not describe *how* the system should do it such as the detailed UI design

---

---

---

---

---

---

---

## Phases of Requirements Analysis

- Existing system
- Proposed system

---

---

---

---

---

---

---

## Products of Requirements Analysis

- Root Concept
- Stakeholder profiles
- Tasks carried out by stakeholders
- Problem Scenarios

---

---

---

---

---

---

---

## Root Concept

- high-level vision: problem statement and proposed solution
- basic rationale
- stakeholder groups & how they will benefit
- starting assumptions

---

---

---

---

---

---

---

## Stakeholder Profiles

- Background
- Expectations
- Preferences
- Relationships

---

---

---

---

---

---

---

---

## Task Descriptions

- Tasks carried out by stakeholders
- Hierarchical task analysis

---

---

---

---

---

---

---

---

## Problem Scenarios

- the setting
- the people involved
- task goals, expectations, plans and actions of the people
- events created by the environment
- artifacts, technology, and systems involved (resources)

---

---

---

---

---

---

---

---

## How do you get this information?

- Artifact analysis
- Interviews
- Observation
- Participation
- Survey/Questionnaire

---

---

---

---

---

---

---

---

## Artifact Analysis

- Collect and examine the documents, objects and other resources that people use in their activities
- Try to understand the content of the information and the role it plays in activities

---

---

---

---

---

---

---

---

## Interviews

- Advantages
  - Gathers opinion, Creates rapport
- Disadvantages
  - Must be well-planned
  - Bias: Information often filtered
- Types
  - Structured
    - Fixed set of questions with simple answers
  - Unstructured
    - More open questions

---

---

---

---

---

---

---

---

## Observation

- Advantages
  - Not an opinion, but an objective record
  - Captures detail
- Disadvantages
  - Intrusive, Time consuming
- Types
  - Passive: “Hanging out”
    - Used in very early design when don't have much information about user's activities
  - Active
    - Provide users with problems to solve or tasks

---

---

---

---

---

---

---

---

## Participation

- When the observer learns and participates in the work activities
- Overcomes the Hawthorne effect
  - Bias of being observed
- Obtain otherwise privileged information
- Creates first-hand domain knowledge

---

---

---

---

---

---

---

---

## Survey/Questionnaire

- Purpose
  - Reaches lots of people
  - Perform statistical analysis on data
  - Avoids bias by anonymity
  - Consistent questions
- Design Issues
  - Must be carefully designed, do pilot
  - Must not be time-consuming & easy to reply
  - Must make sense
  - Must gather precise answers, not vague ones
  - Ask only questions which support the design
  - Sample vs. population

---

---

---

---

---

---

---

---
