Lecture/Disc: What is Software Engineering?

CIS 422/522 Fall 2014 1

Contact Information

- **Instructor contact**
Stuart Faulk
faulk@cs.uoregon.edu
346-1350
Deschutes 354
Computer and Information Science
University of Oregon
Eugene, OR 97403
- **Office Hours: after class, by appointment, or any time my door is open**
 - I respond most quickly to email

CIS 422/522 Fall 2014 2

Instructor Background

- **Real World Experience (20+ years)**
 - R&D U.S. Naval Research Lab
 - R&D Aerospace industry
 - Consulting (DoD, Sharp, Sun, etc.)
- **Teaching industry professionals (15+ years)**
 - Oregon Master of Software Engineering
- **Perspective on Software Engineering as an applied discipline (i.e., what actually works)**

CIS 422/522 Fall 2014 3

CIS 422 Course Format

- **Single Quarter Project Course**
 - Lectures, reading: theory, principles, and methods
 - Projects: learn how to apply SE concepts by doing
 - Project Meetings: learn effective teamwork
 - Project Reviews and Presentations: critique and guidance
- **Two project iterations**
 - First for perspective on SE issues, team development
 - Second to demonstrate ability to apply lessons learned
- **Two exams (midterm, final) assess individual understanding**
- **Schedule on class web site**

CIS 422/522 Fall 2014 4

Emphasis is on Life-Cycle Management and Teamwork

- Participate in collaborative design
- Work as a member of a project team, assuming various roles
- Create and follow project plans
- Create the full range of work products associated with a software product
- Complete project deliverables on time
- *Key point: coding is only part of the work*

CIS 422/522 Fall 2014 5

Projects

- **2 projects: 4 weeks, 6 weeks**
 - Project 1: same basic requirements for everyone
 - Simple but extensible application
 - Focus on project planning and teamwork
 - Project 2: a selection of projects
 - Choose among suggestions
 - Propose custom project
- **Technically simple, but high expectations**
 - Solid freeware quality
 - Complete product includes internal and external documentation, tests

CIS 422/522 Fall 2014 6

Teams

- Form teams of 4-5 people
 - Project 1: Instructor chooses teams
 - Project 2: May re-form teams
- Project grades are a combination of group grade, individual contributions, and peer evaluation
 - Overall grade for project
 - Evaluation of individual contributions
 - Peer evaluation by teammates
 - Record of contributions from Developer Log

CIS 422/522 Fall 2014 7

Grading

- 60% Projects (20+40)
 - Includes presentations, intermediate deliverables
- 30% Exams (15+15)
 - Test for understanding of lectures & reading
- 10% Class Participation: includes but is not limited to...
 - Attendance at class, team meetings
 - Contributing the discussions, class exercises
 - Appropriate behavior in the classroom (i.e. no cell phones, beepers, trolling web)
- Questions?

CIS 422/522 Fall 2014 8

Class Website

- Use class website to track class events
- Schedule page most important
 - Lecture schedule, link to slides
 - Readings due for each lecture
 - Project due dates
 - Examples of work products
- Home page: announcements
- Project page: project description, constraints
- Project grading: how work will be evaluated

CIS 422/522 Fall 2014 9

What is Software Engineering?

CIS 422/522 Fall 2014 10

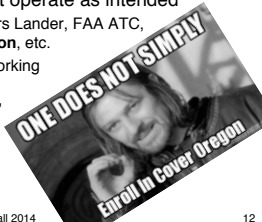

The “Software Crisis”

- Have been in “crisis” since the advent of “big” software (roughly 1965)
- What we want for software development
 - Low risk, predictability (time, cost, functionality, quality)
 - Lower costs and proportionate costs
 - Faster turnaround
- What we have:
 - High risk, high failure rate
 - Poor delivered quality
 - Unpredictable schedule, cost, effort
- Characterized by **lack of control** (inability plan the work, work the plan)

CIS 422/522 Fall 2014 11

Symptoms of the “Crisis”

- One of every four large software project is cancelled
- Average project overshoots schedule by 50%, large project often do much worse
- 75% of large systems do not operate as intended
 - E.g., Ariane 5, Therac 25, Mars Lander, FAA ATC, Universal Credit, **Cover Oregon**, etc.
 - Many fail to deliver a single working line of code
- Really the “state of practice”

CIS 422/522 Fall 2014 12

Discussion Context

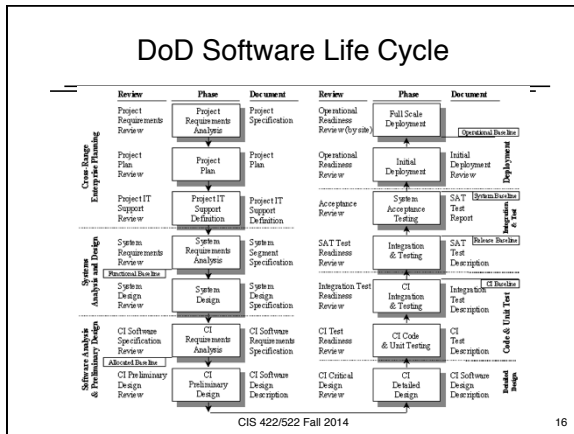

- Focus large, complex systems
 - Multi-person: many developers, many stakeholders
 - Multi-version: intentional and unintentional evolution
- *Quantitatively* distinct from small developments
 - Software complexity grows non-linearly with size
 - Communication complexity grows exponentially
- *Qualitatively* distinct from small developments
 - Multi-person implies need for organizational functions (management, accounting, etc.), policies, oversight, etc.
 - More stakeholders and more kinds of stakeholders
- Rule of thumb: project starts to be “large” development team can’t fit around a table.

Implications

- Small system development is driven by technical issues (I.e., programming, technical understanding)
- Large system development is dominated by organizational issues
 - Problem understanding, managing complexity, communication, coordination, etc.
 - Projects fail when these issues are inadequately addressed
- Key Lesson #1: **programming ≠ software engineering**
 - Techniques that work for small systems fail utterly when scaled up
 - Programming skills alone won’t get you through real developments (or even this course)

Programming View

Origins of SE

- Term “software engineering” was coined at 1968 NATO conference:
 - “Software engineering is the establishment and use of sound engineering principles in order to obtain economically software that is reliable and works efficiently on real machines.”
- Response to “software crisis”
- Desire for software development to be more like mature engineering disciplines
 - Analytical, predictable, manageable
 - But, stated as an aspiration, not the state of practice

CIS 422/522 Fall 2014 17

What has changed since ‘68?

- Incorrect to conclude that no progress has been made
 - Better understanding of issues
 - Substantial improvements in programming languages, tools
 - Better understanding and control of software processes
- But the problems have also changed
 - Improved capabilities often overcome by larger problems, greater complexity
 - Orders of magnitude more code, faster pace of technology, etc.

CIS 422/522 Fall 2014 18

What has not changed?

- Still not an engineering discipline in classic sense
 - Lack of applied mathematics and systematic methods to develop and assess product properties
 - Not taught, licensed, or regulated as an engineering discipline (most of USA)
- Worse, practitioners often don't apply what we know*
 - Existing SE methods, models often not understood or used in industry
 - Little attention is given to processes or products other than code
 - Upshot: quality of products depends on *qualities of the individuals rather than qualities of engineering practices*
- Development continues to be characterized by **lack of control**

CIS 422/522 Fall 2014 19

Historical Comparison

<p>Pre-Industrial</p>  <p style="text-align: center;">The Craftsman</p>	<p>Post-Industrial</p>  <p style="text-align: center;">The Factory</p>
---	--

CIS 422/522 Fall 2014 20

Which best characterizes software?

Pre-Industrial	Post-Industrial
<ul style="list-style-type: none"> • Craftsman builds product <ul style="list-style-type: none"> – Builds one product at a time – Each product is unique, parts are not interchangeable – Quality depends on craftsman's skill – product of training, experience – Many opportunities for error • Focus on individual products <ul style="list-style-type: none"> – Customization is easy • Scaling is difficult <ul style="list-style-type: none"> – Parts are not interchangeable – No economy of scale – Control problems rise <i>exponentially</i> with product size! 	<ul style="list-style-type: none"> • Products produced by machines <ul style="list-style-type: none"> – Quality depends on machines & manufacturing process – Production requires little training or experience • Focus on developing the <i>means of production</i> <ul style="list-style-type: none"> – Craftsman builds means to build product (tools, factory) – Customization is difficult • Easily scales <ul style="list-style-type: none"> – Parts are interchangeable – Products are alike – Economies of scale apply

CIS 422/522 Fall 2014 21

The "Big Project" Problem

- Control problems rise *exponentially* with product size!
- Each interface must be hand fit

CIS 422/522 Fall 2014

22

View of SE in this Course

- The **purpose of software engineering** is to *gain* and *maintain* intellectual and managerial control over the products and processes of software development.
 - “Intellectual control” means that we are able make rational choices based on an understanding of the downstream effects of those choices (e.g., on system properties).
 - Managerial control similarly means we are able to make rational choices about development *resources* (budget, schedule, personnel).
- Memorize this!

CIS 422/522 Fall 2014

23

Both are necessary for success!

- Intellectual control implies
 - We understand what we are trying to achieve
 - Can distinguish good choices from bad
 - We can reliably and predictably build to our goals
 - Functional behavior
 - Software Qualities (reliability, security, usability, etc.)
- Managerial control implies
 - We make accurate estimations
 - We deliver on schedule and within budget
- Assertion: managerial control is not really possible without intellectual control (no matter what the Harvard School of Business says)

CIS 422/522 Fall 2014

24

Course Approach

- Will learn practical methods for acquiring and maintaining control of software projects
- Intellectual control
 - Methods for software requirements, architecture, design, test
 - Modeling methods and notations
 - What to produce, how to make decisions, how verified?
- Managerial control
 - Planning and controlling development
 - Process models addressing development
 - People management and team organization
 - When, who, how much?
- Caveat: we can only simulate the problems of large developments

Questions?

Team Assignments

Team 1	Team 2	Team 3
Fowler, Sean	Arana, Frankie	Wilhelm, Blayze
Jones, Tristan	Fok, Alex	Cabbie, Tim
Leef, Marc	Moch, Lily	Prescott, Dylan
Ramos Rafael, Gabriel	Rodrigues Vasconcelos, Gui	Ringot, Alexis
Shore, Matt	Wong, Jimmy	Timora, Eric
Team 4	Team 5	Team 6
Blanchard, John	Bakke, Joe	Dempsey, Jack
Delumpa, William	Dickinson, Jacob	Gyde, Wesley
Kelly-Reif, Chase	Holmberg, Kyle	Haynes, Matt
Rodrigues, Renan	Jensen, Branden	Steringer, Erik
Therrell, Colter	Oglesby, Ben	

Assignment

- Project
 - Forward your emails from xxx@uoregon.edu
 - First meeting (in class)
 - Give me a primary point of contact (email)
 - Plan and hold at least one project meeting out of class if possible
 - Set up your Assembla spaces
 - Look at examples from past classes
 - Set up your team page
 - Discuss possible roles
